DESCRIPTORS: *Geophysical prospecting, *Well
logging, Radioactivity, Sedimentary rock, Geology,
*Radiation measurement systems,

To survey the distribution of radioactivity intensity,
making use of existing deep drill holes in the regions
of sedimentary rocks, a large size logger was manu-
factured, and the method of measurement and analysis
of the obtained values was studied. Experimental
logging was carried out in the Joban district, but no
anomaly of radioactivity intensity was recognized.

If in the presence of a third element in an alloy the expulsion rate of the volatile component is increased, then the compression of the sample is reduced and the total pore volume is increased. If the expulsion rate is reduced in the presence of the third element, the compression of the sample increases and the total porosity decreases.
